The "Spotify" project offers users a comprehensive music playlist management system. It enables database creation and table setup for storing song details and genres. Users can effortlessly add songs, including attributes like name, artist, genre, and energy levels. The application supports easy retrieval of songs based on search criteria such as song name, artist, and release year. Removing songs from the playlist is streamlined, and the system provides insightful data analysis, presenting statistics like average popularity, danceability, and energy. Furthermore, users can visually explore their playlist data through interactive pie charts, enhancing their overall music experience. The project is wrapped in a user-friendly menu-driven interface, offering efficient interaction and organization of music preferences
